Project: AegisAI — Proof-of-Verification network on Solana

Contact: aegisai@mail.grokbot.com · X @AegisAI_Sol · https://github.com/aegisai-sol/aegisai · https://bold-thistle-3z5f.here.now/

Location: Bulgaria (EU)

Problem

AI output is exploding, but nobody can cheaply prove an AI answer, label or agent action was checked. Centralized checking is expensive and opaque.

Solution

A network where ordinary, low-power devices (old laptops, phones, browsers) perform small verification micro-tasks on AI outputs. Validators with bonds sample-check results; fraud is slashed. Clients pay per verified result.

What is new: PoV-R (Proof-of-Verification Reservoir)

Hard cap 1B AGIS, mint authority revoked after genesis — no inflation.

40% sits in an on-chain Reservoir. Devices earn non-transferable Proof Credits.

Credits convert to AGIS only up to ~70% of fees actually paid that epoch (plus a small bootstrap bonus that halves every 6 months and ends in 3 years), capped at 0.5% of the Reservoir per epoch.

Rewards follow real demand, not a calendar — unlike schedule-based DePIN emissions.

Why Solana

Cheap, fast settlement for millions of micro-payments and credit updates; SPL + compressed state for per-device records.

Status

Brand, site, X, GitHub repo with working verify engine (POST /v1/verify), Proof-of-Source, canaries, Proof Credits ledger, tokenomics spec. No token minted (deliberately — no launch before audited program and real liquidity).

Encode Solana Hackathon 2026

Live demo: https://bold-thistle-3z5f.here.now/verify.html · Repo commit 67ab9e8. Working: verify API, Proof-of-Source, canaries, off-chain Proof Credits. Next: devnet program + on-chain receipts.
